Test Screening Security

for your recruited audience test with Indee

Forensic Pixel Tracking Watermarks

Every single video copy is individually watermarked with the viewer's info. Visual and invisible forensic watermarks ensure no one can anonymously leak your video.

No Single Video File

We break every video into thousands of little files so even if a hacker was to figure out how to download one of the files he would need to locate the remaining 999 files for your video from 12 million other files we store.

Self Destruction Coded In

We track every single view so the screeners will self-destruct if shared or viewed indiscriminately.

Encryption & DRM Ready

All videos are encrypted with AES-128 encryption and access to your information and test results are protected with SHA-256 access encryption. In addition to this we offer DRM ready streams.

2Factor Authentication

We offer users the option of further securing their screeners with the help of phone authentication either via SMS or phone call. This way a tester would be required to enter an OTP to begin viewing the stream.
